

White Paper: Outdated Application Security Tools Put Federal Agencies at Risk

Agencies Must Reduce Vulnerabilities Without Losing Development Speed

Federal agencies have broadly adopted Agile and DevOps development environments in order to accelerate delivery of new applications and achieve mission goals. Unfortunately, the benefits of adopting these processes have not been instantaneous, with speed and application security both suffering.

Government agencies need advanced application security designed for speed, agility, efficiency, and the defensive requirements of their unique attack surface.

Read this white paper to learn how legacy application security tools:

- Can be difficult to deploy and scale across an agency due to incompatibilities
- Contribute to alert fatigue for security teams
- Rely on manual workflows that bottleneck vulnerability remediation and delay delivery cycles
- May not ensure compliance with the latest standards, regulations, and privacy laws
- Increase operating costs
