

Service mesh together with API management

Unifying governance, security, and discoverability across your microservices and APIs

Studies show that 91% of enterprises are using or have plans to use microservices. However, microservices can't function alone, and many organizations face three major challenges: governance, security, and discoverability. Service mesh, combined with API management, can increase microservices agility by allowing you to centrally manage, scale, secure, and discover any service in any architecture.

Read this whitepaper to learn:

- How to use service mesh and API management to discover, manage, and secure any service deployed in Kubernetes.
- How API management capabilities give you the ability to secure east-west and north-south traffic from a single control plane.
- How to increase microservices agility using a unified platform for service mesh and API management.
