

Maximizing the Potential of Observability

As organizations look to speed software delivery and innovation, they have turned to modern application architectures. While cloud-native microservices based environments are great for increasing velocity, they bring more complexity and challenges for those responsible for application performance. To meet these challenges a new approach combining the power of Enterprise Observability and REAL Artificial Intelligence is required.

Join us on May 6th to learn from Mirko Novakovic, CEO of Instana, and Rama Akkiraju, CTO AI Operations at IBM, as they discuss the current benefits and future requirements of Enterprise Observability and Artificial Intelligence. In this lively conversation they will cover topics such as:

- What is AIOps for DevOps?
- What are the possibilities of AI in solving real world challenges?
- What are the pros and cons of AI?
