

Ivanti Unified Endpoint Manager

Data Sheet

Ivanti Unified Endpoint Manager

Ivanti® Unified Endpoint Manager—or Ivanti UEM—increases user and IT productivity by helping IT administrators gather detailed device data, automate software and OS deployments, personalize workspace environments, and fix user issues quickly. Ivanti UEM is the only solution that personalizes the user workspace, while letting IT Analysts and Admins do their magic for all devices from one management experience—not through two, three, four or more consoles.

Act Faster with Greater Visibility

The discovery and inventory of all endpoints is key to unifying IT. When you add the right data integrated into a business-value dashboard, life in IT becomes clearer and actions happen faster. Ivanti® Xtraction helps you create business-value dashboards easily—without data scientists or gurus—and ties together all your information into data visualizations that make sense and promote quick action from your teams.

Unified Management Across More Devices

Organizations must address how to manage and enable the operating systems, applications, and profiles in corporate environments. It's time to end the complexities of separate solutions for Enterprise Mobility Management (EMM), client management, and user experience management. When you deploy the right Unified Endpoint

Management (UEM) solution, expect it to do the following:

- Simplify and secure enterprise mobility alongside your users' laptops and desktops
- Apply policies, personalization, and actions quickly across all devices
- Provide assets or services to users via self-service or a targeted distribution
- Leverage the intelligence of the system to determine which users and devices get what

No one else can do this like Ivanti because others don't unify the management of all systems users leverage—Windows (physical and virtual), macOS, Linux, Unix, iOS, and Android. We even help you manage IoT devices like Apple TV and Raspberry Pi.
