

# Cloud Court: Bring Your (Use) Case

Learn what use-cases are best suited for public and/or private cloud

When it comes to deciding where to deploy your organisation's valuable data and analytics workloads, the decisions can be overwhelming and complex. Which workloads should go to the public cloud and which should stay on-prem in a private cloud? And which makes sense to move between the two locations?

Join this live interactive panel with data and analytic experts to learn which common use cases are best in the cloud or on-prem in a private cloud.

Our team will debate the best infrastructure locations for these common use cases to determine the formula for success:

- Establish a data science factory
- Seasonal analytics
- Regulatory compliance for vendor independence
- Consistent analytics for regions with varying maturity

After attending this live debate, you'll understand what types of use cases are best suited for public and/or private cloud and the value of a hybrid platform.
