# IDC Detecting Vulnerabilities with Cloud-Native Security

In this article, IDC discusses the topic of cloud-native security as a set of security measures that are an integral part of the cloud offering. Cloud-native security is a service that the cloud provider offers to application developers security professionals, and cloud environment owners seeking to realize the benefits of flexibility, choice, and ease of deployment, regardless of where the ownership of security lies in the shared responsibility model.

In any conversation about responsibilities regarding the security of the cloud, it is the cloud provider's responsibility to furnish the security and integrity required to deliver on the cloud's promises of flexibility choice, and ease of deployment.
