2023 ForgeRock Identity Breach Report

2023 ForgeRock Identity Breach Report

IT ONLY TAKES ONE EXPOSED PASSWORD.
To protect sensitive data, secure every identity across your business ecosystem.

It only takes one exposed password. To protect sensitive data, secure every identity across your business ecosystem.

Most large organizations connect and share data with dozens of partners and vendors. But a compromised login credential in any one of those companies can put all the others at risk. Our latest identity breach report shows that attackers are seeking out these vulnerabilities to perpetrate "third-party breaches," which rose 136% last year.

The ForgeRock 2023 Breach Report reveals three major trends:

- Stolen identity data can lead to long-term problems – Breached records that include Social Security Numbers and protected health information (PHI) are on the rise, and can be used for ongoing fraud.
- Third-party breaches broaden impact – Attackers are exploiting weak security controls to infiltrate all the organizations in a vendor's ecosystem.
- Vulnerability and resilience vary – Some sectors have successfully reduced breaches, but attacks on healthcare and education have been large – and expensive.

Read the ForgeRock 2023 Identity Breach Report to gain insights into data breaches across various industries and regions, including the U.S., UK, Germany, Australia, and Singapore.
