

DataFlow: Move mission-critical data from anywhere to anywhere else in minutes

DataFlow: Move mission-critical data from anywhere to anywhere else in minutes

For many companies, cloud costs and complexity are growing out of control as data volumes continue to accelerate. Cloudera Data in Motion is the most efficient, trusted, and complete solution on the planet today for data ingestion, streaming, processing and distribution.

Watch this session where we will explain and demonstrate two newly released features of Cloudera Data Flow that will further enhance the efficiency of your data pipelines.

The two new features are:

- DataFlow Designer, a single development environment to help teams more effectively build and manage data flows that can take advantage of the auto-scaling, flow isolation and KPI monitoring capabilities of the cloud.
- DataFlow Functions, a no-code, flow development UI for serverless compute services, helping reduce TCO for event-driven workloads and take full advantage of cloud scalability and development velocity.
